

General Safety Information

CAUTION – To avoid serious injuries:

The power modulator is a device that makes it easier to control braking by increasing the cable stroke at the brake lever within a certain constant range of braking force.

If the effective operating range of the power modulator is exceeded, the brake will operate as a normal brake (sensitive and powerful). In that case, the brakes may operate more powerfully than intended and may cause the wheel to lock up. Therefore it is essential that you fully understand and test the performance of the power modulator before use.

The power modulator is not equipped with a function to prevent the wheel from locking up.

Braking Performance Comparison

SI-PM50A

SM-PM50

Power Modulator

Before use, read these instructions carefully, and follow them for correct use.

Technical Service Instructions

The SM-PM50 is designed for use with the BR-C501 brake system. In order to realize the best performance, we recommend that the following combination be used.

Series	NEXAVE
Brake lever	ST-C503
Brake caliper	BR-C501
Rotor	SM-RT50
Brake cable	

Installing the SM-PM50

Install the SM-PM50 power modulator to the ST-C503 brake lever as shown in the illustration.

Note:

- When the brakes are applied, the outer casing at the brake caliper end will move about 6 mm toward the brake lever, so make sure there is enough excess length in the outer casing for this to happen.
- Install the power modulator in a position where it will not interfere with the brakes when they are applied.
- Install the power modulator in a position where it will not interfere with the frame.

Please note: Specifications are subject to change for improvement without notice. (English)
