

## General Safety Information

**CAUTION** – To avoid serious injuries:

The power modulator is a device that makes it easier to control braking by increasing the cable stroke at the brake lever within a certain constant range of braking force.

If the effective operating range of the power modulator is exceeded, the brake will operate as a normal V-Brake (sensitive and powerful). In that case, the brakes may operate more powerfully than intended and may cause the wheel to lock up. Therefore it is essential that you fully understand and test the performance of the power modulator before use.

**The power modulator is not equipped with a function to prevent the wheel from locking up.**

### Braking Performance Comparison

SI-PM60A

# SM-PM60

Power Modulator

Before use, read these instructions carefully, and follow them for correct use.

## Technical Service Instructions

The SM-PM60 is designed for use with the BR-F700 brake system. In order to realize the best performance, we recommend that the following combination be used.

Series	Capreo
Brake lever	BL-F700
V-Brake	BR-F700
Brake cable	

## Installing the SM-PM60

Install the SM-PM60 power modulator to the BL-F700 brake lever as shown in the illustration.

### Note:

- When the brakes are applied, the outer casing at the V-Brake end will move about 10 mm toward the brake lever, so make sure there is enough excess length in the outer casing for this to happen.
- Install the power modulator in a position where it will not interfere with the brakes when they are applied.
- Install the power modulator in a position where it will not interfere with the frame.

Please note: Specifications are subject to change for improvement without notice. (English)
